DETAILED ACTION

I. This office action correspondence is a response to the applicant's amendment filed on 02/19/2008. After reconsideration of the applicant's argument filed on 02/19/2008, further search and through examination of the present application, claims 1-4,10-13 are found to be in condition for allowance over prior arts of record.

EXAMINER'S AMENDMENT

2. An examiner's amendment to the record appears below. Should the changes and/or additions be unacceptable to applicant, an amendment may be filed as provided by 37 CFR 1.312. To ensure consideration of such an amendment, it MUST be submitted no later than the payment of the issue fee.

Authorization for this examiner's amendment was given in a telephone interview with Timothy G Beechen on 05/23/2008.

3. The application has been amended as follows:

In the claims,

In line 2 of claim 3 please delete "compound".

Please cancel claims 5-9.

Reasons for allowance

5. In independent Claims 1,10-12 are patentable over the closest references of Farley et al (hereinafter referred as Farley) US Patent No 7,089,428 B2 in view of Mcclure et al (hereinafter referred as Mcclure) US Patent 7,152,105 B2 and further in view of

O'Sullivan(US Pub No 2006/0095569 A1) because they do not anticipate nor fairly and reasonably teach a computer-implemented method for determining network security threat level, comprising the steps of; receiving event data in response to identified network event detected by a sensor; based upon the event data, perform the following step: determining a source threat value, the source threat value based upon a source threat weight for a source IP address and a first range of IP network addresses of which the source IP address is a member; determining a destination vulnerability value, the destination vulnerability value based upon the network event in conjunction with a destination IP address, a destination threat weight for the destination IP address, and a threat level value associated with a second range of network IP address of which the destination IP address is a member; determining an event validity value based upon the source IP address and an event type determining event severity value based upon the event type; calculating an event threat level value based upon the source threat value, the destination vulnerability value, the event validity value, and the event severity value; calculating a host threat level value based upon a summation of event threat level values for a host over a first time period associated with a number of correlated events for the host in the first time period; calculating a differential threat level by associating the host threat level value with a second host threat level value based upon a second time period wherein the second time period exceeds the first time period; generating at least one of: a threat report and threat presentation.

6. In independent Claim 13 are patentable over the closest references of Farley et al (hereinafter referred as Farley) US Patent No 7,089,428 B2 in view of Mcclure et al (hereinafter referred as Mcclure) US Patent 7,152,105 B2 and further in view of Art Unit: 2136

Friedrichs et al(US Pub No 2003/0084349) because they do not anticipate nor fairly and reasonably teach a method for determining network security threat level, comprising the steps of: receiving event data in response to an identified network event detected by a sensor; determining an event type based upon the event data; based upon the event data, perform the following steps: determining a first host frequency threat level value by summing event threat level values for a host over a first time period dividing by the number of correlated events for the host in the first time period; determining a second host frequency threat level value by summing event threat level values for the host over a second time period greater than the first time period and associated with the number of correlated events for the host in the second time period; and determining a differential threat level numerator by multiplication of the first host frequency threat level value by the second time period; determining a differential threat level denominator by multiplying the second host frequency value by the first time period, and calculating a differential threat level by diving the differential threat level numerator by the differential threat level denominator; generating at least one of: a threat report and a threat presentation based at lest on the calculated threat level; and outputting the at least one of: threat report and threat presentation.

Conclusion

- Claims 1-4,10-13 are patentable.
- 8. Any comments considered necessary by applicant must be submitted no later than the payment of the issue fee and, to avoid processing delays should be clearly labeled "Comments on statement of Reasons for allowance."
